INTRODUCTION

Database is similar to a digital filing cabinet that is used to manage, store, and arrange data for convenient access. The documentation concepts covered in the database systems course during the second semester are put into practice in this material. This project's main objective is to illustrate important ideas related to normalization, creating SQL queries, and using charts to illustrate data insights. In order to show how database techniques may be successfully applied to real-world data management and processing difficulties across multiple sectors, the project includes processing and illustrating data from a provided CSV file.

NORMALIZATION

Normalization is a technique used to effectively arrange data. Large, disorganized tables can be divided into smaller, more sensible ones with its assistance.

In database, normalization is a procedure used to appropriately arrange data so that:

- No needless duplication or repetition exists.
- The data is accurate, tidy, and manageable.
- The database is less prone to errors and is more efficient.

Phases of normalization

1. UNNORMALIZED FORM (UNF)

Unnormalized Forms (UNFs) can contain complicated or nested data, such as lists inside a single field, and store data in a single table or collection that frequently contains duplication, such as repeated names or addresses.

UNF	LEVEL
CustomerID	1
FullName	1
Address	1
ContactNumber	1
Email	1
CustomerTypeID	1
FutureHost	1
OrderID	2
OrderDate	2
OrderType	2
PartyID	3
PartyDate	3
PartyTime	3
NumberOfGuests	3
ProductID	4
ProductName	4
Description	4
Price	4
OrderDetailsID	5
ProductID	5
Quantity	5
UnitPrice	5
PaymentMethod	5
Amount	5
PaymentDate	5
CategoryID	6
CategoryName	6
Comments	6
SupplierID	7
SupplierName	7
Email	7

Figure 1: UNF

2 FIRST NORMAL FORM (1NF)

In database normalization, the first normal form (1NF) is the fundamental step. Only single, indivisible values—also referred to as atomic values—must be present in each table column in order to meet 1NF. This means that the table should only have one piece of data stored in each cell, and that no columns should have repeating groups or multiple values.

CUSTOMERS		
PK	<u>CustomerID</u>	int
FK	FullName	varchar
	Address	varchar
	ContactNumber	varchar
	Email	varchar
	CustomerTypeID	int
	FutureHost	bool
	TypeName	varchar
	Description	varchar

ORDER		
PK	<u>OrderID</u>	int
FK	CustomerID	int
	OrderDate	date
	OrderType	varchar

PARTY		
PK	<u>PartyID</u>	int
FK	HostCustomerID	int
	PartyDate	date
	PartyTime	time
	NumberOfGuests	int

ORDER_DETAILS		
PK	<u>OrderDetailsID</u>	int
FK	OrderID	int
	ProductID	int
	Quantity	int
	UnitPrice	decimal
	PaymentMethod	varchar
	Amount	decimal
	PaymentDate	date

CATEGORIES		
PK	<u>CategoryID</u>	int
	CategoryName	varchar
	Comments	varchar

PRODUCTS		
PK	<u>ProductID</u>	int
PK	<u>ProductCode</u>	int
FK	ProductName	varchar
	Description	text
	Price	decimal
	SupplierID	int
	CategoryID	int

SUPPLIERS		
PK	<u>SupplierID</u>	int
	SupplierName	varchar
	Email	varchar
	ContactNumber	varchar

Figure 2: 1NF

3. 2NF

Second Normal Form (2NF) is based on fully functional dependency. A database normalization procedure called Second Normal Form (2NF) further reduces data redundancy and ensures data integrity.

CUSTOMERS		
PK	<u>CustomerID</u>	int
	FullName	varchar
	Address	varchar
	ContactNumber	varchar
	Email	varchar
FK	CustomerTypeID	int
	FutureHost	bool

CUSTOMER_TYPE		
PK	<u>CustomerTypeID</u>	int
	TypeName	varchar
	Description	varchar

ORDER		
PK	<u>OrderID</u>	int
FK	CustomerID	int
	OrderDate	date
	OrderType	varchar

PARTY		
PK	<u>PartyID</u>	int
FK	HostCustomerID	int
	PartyDate	date
	PartyTime	time
	NumberOfGuests	int

PRODUCTS		
PK	<u>ProductID</u>	int
PK	<u>ProductCode</u>	int
	ProductName	varchar
	Description	text
	Price	decimal
FK	SupplierID	int
Fk	CategoryID	int

ORDER_DETAILS		
PK	<u>OrderDetailID</u>	INT
	OrderID	int
	ProductID	int
	Quantity	int
	UnitPrice	decimal
	PaymentMethod	varchar
	Amount	decimal
	PaymentDate	date

SUPPLIERS		
PK	<u>SupplierID</u>	int
	SupplierName	varchar
	Email	varchar
	ContactNumber	varchar

CATEGORIES		
PK	<u>CategoryID</u>	int
	CategoryName	varchar
	Comments	varchar

Figure 3: 2NF

4. 3NF

According to 3NF, a table must be in 2NF and all non-key characteristics must rely solely on the primary key and not on any other non-key attributes. This enhances data integrity and eliminates transitive dependencies.

CUSTOMERS		
PK	<u>CustomerID</u>	int
	FullName	varchar
	Address	varchar
	ContactNumber	varchar
	Email	varchar
FK	CustomerTypeID	int
	FutureHost	bool

CUSTOMER_TYPES

ENTITY RELATIONSHIP DIAGRAM (ER DIAGRAM)

An entity-relationship (ER) diagram is a diagram of a database's structure. It displays the system's primary entities, or items or objects, together with their attributes, or specifics about them, and the connections between them.

Figure 5: ER Diagram

SQL QUERIES

SQL queries are structured query language (SQL) instructions used to interact with and control data in databases.

1.The Generated Tables

```
CREATE TABLE CUSTOMER_TYPES (  
    CustomerTypeID INT PRIMARY KEY AUTO_INCREMENT,  
    TypeName VARCHAR(50) NOT NULL,  
    Description VARCHAR(255)  
);
```

Figure 6: create table / customer types

```
CREATE TABLE CUSTOMERS (  
    CustomerID INT PRIMARY KEY AUTO_INCREMENT,  
    FullName VARCHAR(100) NOT NULL,  
    Address VARCHAR(255),  
    ContactNumber VARCHAR(20),  
    Email VARCHAR(100),  
    CustomerTypeID INT,  
    FutureHost BOOLEAN DEFAULT FALSE,  
    FOREIGN KEY (CustomerTypeID) REFERENCES CUSTOMER_TYPES(CustomerTypeID)  
);
```

Figure 7: customers

```
CREATE TABLE PARTY (  
    PartyID INT PRIMARY KEY AUTO_INCREMENT,  
    HostCustomerID INT,  
    PartyDate DATE,  
    PartyTime TIME,  
    NumberOfGuests INT,  
    FOREIGN KEY (HostCustomerID) REFERENCES CUSTOMERS(CustomerID)  
);
```

Figure 8: party

```
CREATE TABLE SUPPLIERS (  
    SupplierID INT PRIMARY KEY AUTO_INCREMENT,  
    SupplierName VARCHAR(100),  
    Email VARCHAR(100),  
    ContactNumber VARCHAR(20)  
);
```

Figure 9: suppliers

```
CREATE TABLE CATEGORIES (  
    CategoryID INT PRIMARY KEY AUTO_INCREMENT,  
    CategoryName VARCHAR(50),  
    Comments VARCHAR(255)  
);
```

Figure 10: categories

```
CREATE TABLE PRODUCTS (  
    ProductID INT PRIMARY KEY AUTO_INCREMENT,  
    ProductCode INT,  
    ProductName VARCHAR(100),  
    Description TEXT,  
    Price DECIMAL(10,2),  
    SupplierID INT,  
    CategoryID INT,  
    FOREIGN KEY (SupplierID) REFERENCES SUPPLIERS(SupplierID),  
    FOREIGN KEY (CategoryID) REFERENCES CATEGORIES(CategoryID)  
);
```

Figure 11: products

```
CREATE TABLE ORDERS (  
    OrderID INT PRIMARY KEY AUTO_INCREMENT,  
    CustomerID INT,  
    OrderDate DATE,  
    OrderType VARCHAR(50),  
    FOREIGN KEY (CustomerID) REFERENCES CUSTOMERS(CustomerID)  
);
```

Figure 12: orders

```

CREATE TABLE ORDER_DETAILS (
    OrderDetailsID INT PRIMARY KEY AUTO_INCREMENT,
    OrderID INT,
    ProductID INT,
    Quantity INT,
    UnitPrice DECIMAL(10,2),
    FOREIGN KEY (OrderID) REFERENCES ORDERS (OrderID),
    FOREIGN KEY (ProductID) REFERENCES PRODUCTS(ProductID)
);

```

Figure 13: order details

```

CREATE TABLE PAYMENTS (
    PaymentID INT PRIMARY KEY AUTO_INCREMENT,
    OrderID INT,
    PaymentMethod VARCHAR(50),
    Amount DECIMAL(10,2),
    PaymentDate DATE,
    FOREIGN KEY (OrderID) REFERENCES ORDERS (OrderID)
);

```

Figure 23: payments

3. Write a query that selects the first name and surname of customers alphabetical order of first name

```
SELECT
    SUBSTRING_INDEX(FullName, ' ', 1) AS FirstName,
    SUBSTRING_INDEX(FullName, ' ', -1) AS Surname
FROM CUSTOMERS
ORDER BY FirstName ASC;
```

The screenshot shows a database interface with a 'Result Grid' tab. Above the grid, there are icons for 'Filter Rows', 'Export', and 'Wrap Cell Content'. The grid itself has two columns: 'FirstName' and 'Surname'. It contains four rows of data, sorted alphabetically by first name.

	FirstName	Surname
▶	Anish	Kc
	Krish	Rai
	Om	Thapa
	Raj	Joshi

Figure 24: Alphabetical-order

4. Write a query that selects all orders by date in descending order

```
SELECT *
FROM ORDERS
ORDER BY OrderDate DESC;
```

The screenshot shows a database interface with a 'Result Grid' tab. Above the grid, there are icons for 'Filter Rows', 'Edit', 'Export/Import', and 'Wrap Cell Content'. The grid has five columns: 'OrderID', 'CustomerID', 'OrderDate', and 'OrderType'. It contains five rows of data, sorted in descending order by 'OrderDate'.

	OrderID	CustomerID	OrderDate	OrderType
▶	4	2	2018-04-25	Email
	3	1	2018-04-08	Party
	2	3	2018-03-24	Party
	1	2	2018-01-12	Email
*	NULL	NULL	NULL	NULL

Figure 25: Descending-order

5. Write a query that counts all the orders where the payment method is cash

```
SELECT COUNT(*) AS CashOrderCount
FROM PAYMENTS
WHERE PaymentMethod = 'Cash';
```

	OrderID	CustomerID	OrderDate	OrderType
▶	4	2	2018-04-25	Email
	3	1	2018-04-08	Party
	2	3	2018-03-24	Party
	1	2	2018-01-12	Email
*	NULL	NULL	NULL	NULL

Figure 26: count

6. Write a query that returns all party orders and date ordered where quantity is greater than 25

```
226 • SELECT o.OrderID, o.OrderDate
227 FROM ORDERS o
228 JOIN ORDER_DETAILS od ON o.OrderID = od.OrderID
229 WHERE o.OrderType = 'Party' AND od.Quantity > 25;
```

	OrderID	OrderDate
--	---------	-----------

Figure 27: Quantity > 25

7. Update email addresses of suppliers. For example: ABC to abc-supplier@abc.net

```
232 • UPDATE SUPPLIERS
233   SET Email = 'abc-supplier@abc.net'
234   WHERE SupplierID = 12;
235 • select * from suppliers;
```

SupplierID	SupplierName	Email	ContactNumber
1	CDE	supplier@cde.co	1252776789
2	GHI	supplier@ghi.com.np	1200467876
12	ABC	abc-supplier@abc.net	1282456762
34	DEF	supplier@def.com	1705674890
* NULL	NULL	NULL	NULL

Figure 28: update-email

8. Add a new category 'Healthy Eating' to the category table

```
238 • INSERT INTO CATEGORIES (CategoryName, Comments)
239   VALUES ('Healthy Eating', 'Category for healthy food products');
240 • select * from categories;
241
```

CategoryID	CategoryName	Comments
1	Skincare	Summer Season
2	Bodycare	Summer Range
3	Makeup	All minerals
4	Haircare	All products
* NULL	NULL	NULL

Figure 29: New-category

9. Update the customer type for Krishna Rai from Host to Ambassador

```

242 • UPDATE CUSTOMERS

DATA VISUALIZATION

In conclusion, this course gave students a strong foundation in database administration and design. I developed a thorough understanding of how to efficiently organize, handle, and comprehend data through tasks including building SQL tables, ER diagrams, performing normalization, and visualizing data. Data visualization is widely used in business, research, and many other industries since it saves time and increases the accuracy of data interpretation.

The objective of data visualization is to make complex data easier to comprehend and analyze by presenting it in an understandable and visually appealing manner.

```
from google.colab import files
uploaded = files.upload()
```

```
import pandas as pd
df = pd.read_csv("googleplaystore(in).csv")
df_cleaned = df.copy()
df.head()
```

```

Free vs Paid Apps

CONCLUSION

To sum up, this course gave students a thorough understanding of database system design and administration. I developed a strong grasp of how to efficiently organize, store, and analyze data by building SQL tables, generating an Entity-Relationship (ER) diagram, using normalization techniques, and visualizing data. These abilities have improved my capacity to create organized databases and effectively communicate data insights, both of which are critical for efficient data administration and decision-making.
